UNIT TEST STRUCTURE

```kotlin
@Test
fun `it should return empty string`() {
    //given
    val useCase = UseCase()

    //when
    val actual = useCase.execute()

    //then
    val expected = ""
    assertEquals(expected, actual)
}
```

BORING ASSERTIONS

- Does my unit converter produces expected output?

- Does my Gson adapter converts Json to proper objects?

```kotlin
class UseCaseTest {
    @Test
    fun `it should return empty string`() {
        val useCase = UseCase()

        val actual = useCase.execute()
        val expected = ""

        assertEquals(expected, actual)
    }
}
```
